

data sheet multi-user

Multi-User functionality allows you to have Content Manager installed on many workstations throughout the organization, with each user given the capability to modify selective components of your digital signage network. As an administrator you can identify individual users or groups and have the ability to restrict access to specific functionality based on access needs. Multi-user offers secure access to the software, prompting users for a user name and password upon start-up. Ideal for customers with large digital signage networks and multiple users managing different aspects of the network. Additionally, you can integrate to existing users and groups in Active Directory/Windows as an alternative to creating users and/or groups specific to the Content Manager software.

features | benefits

- Install and use more than one copy of Content Manager and allow multiple users and/or groups to modify selective components of the signage configuration
- Maintenance of Datasets, Locations, Screens, Regions and Content items can all be restricted to individual users and groups
- Groups can be split up however you like – property, local, regional, etc.
- Audit trail – view who did what within the system
- Secure access to software – prompt for user name and password
- Ideal for larger scale deployments
- Several people can be set up as administrators, but only administrators can set up users and groups
- Under properties, the administrator will now have a security tab where you can allow or deny users and/or groups access to certain functionality
- Users and groups will not have access to the security settings, unless they are identified as an administrator
- Simplify setup by leveraging existing/corporate security entities
